

MIECHV FY 2025 SUMMARY

The home visiting programs are addressing many of the identified needs for their enrolled families. This has been demonstrated by both the robust program outcomes reported over time and home visiting satisfaction survey results.

These characteristics embody MIECHV enrollees from 2017 to 2025:

- The number of **enrolled caregivers increased from 493 in 2017 to 1,202 in 2025** and correspondingly the **number of index children increased from 458 to 1,146**.
- The caregivers were disproportionately **between ages 22 and 34 years** and the index children were **generally under three years of age**.
- The most commonly reported educational attainment among caregivers was a **high school diploma/GED (43.0 percent in 2025)**.
- The overwhelming majority of enrollees reported **speaking English** at home.
- Most of the caregivers and index children reported **having Medicaid or CHIP** as their health insurance coverage (71.4 percent in 2025).

Overall, the MIECHV-supported sites fare well on most benchmarks, particularly early childhood-related benchmarks. The following are some of the successes reported during FY 2025 (October 1, 2024 to September 30, 2025):

- The **overwhelming majority of newly enrolled mothers were documented as receiving a depression screening** with the Patient Health Questionnaire-9 (PHQ-9).
- Approximately **four-fifths of prenatally enrolled mothers were reported as receiving a postpartum care visit** within three months of delivery.
- Of children enrolled in home visiting, **84.6 percent were reported as receiving an Ages and Stages Questionnaire (ASQ) screening** at the age-appropriate time interval.
- Of enrolled children, **88.8 percent were reportedly in a household in which a family member was documented as reading, telling stories, and/or singing songs with the child most days during a typical week**.
- **More than 90.0 percent of newly enrolled primary caregivers were documented as being screened for intimate partner violence**.
